

# SAMPLE PAPER-II SOLUTION FOR

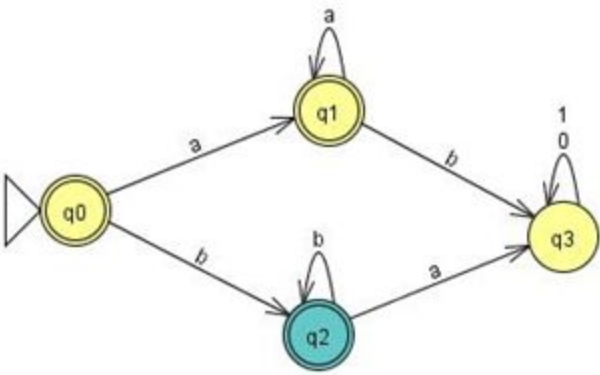

IN SEMESTER ASSESSMENT (ISA-1)- B.TECH III SEMESTER  
October, 2020

## Automata Formal Languages & Logic

Time: 2 Hrs

Answer All Questions

Max Marks: 60

1.	a)	<p>Consider the function defined by the rule <math>f(x)=\{2x+2 \text{ for } 0 &lt; x &lt; 5\}</math>, specify the range and domain of the function.</p> <p><b>Solution:</b></p> <p>Range: 4, 6, 8, 10</p> <p>Domain: 1, 2, 3, 4</p>	2
	b)	<p>Let <math>L</math> be the language ,  <math>L = \{ w \in \{a^*\} \text{ or } w \in \{b^*\} , \Sigma \{a,b\}^* \}</math>            Construct a DFA that accepts all the strings that are in <math>L</math> and rejects all the strings that are not in <math>L</math>.</p> <p><b>Solution:</b></p> 	4
	c)	<p><b>Answer the following:</b></p> <p>i) Consider the following DFA,</p>	2+2

**Give one sentence description of the above DFA**

**Solution:**

$L(DFA) = \{n_1(w) \bmod 4 = 3, \Sigma = \{0,1\}^*\}$

**ii) Draw the transition diagram for the FA**

$M = \{(A,B,C,D), (0,1), \delta, c, (A,C)\}$

$\delta(A,0) = A, \delta(A,1) = \{B,C\}$

$\delta(B,0) = B, \delta(B,1) = \{A,C\}$

$\delta(C,0) = \{B,C\}, \delta(C,1) = \{B,D\}$

$\delta(D,0) = \{A,B,C,D\}, \delta(D,1) = \{A\}$

**Solution:**

2

a)

**Construct an NFA with six states that accepts the string over the alphabet {a,b} with either even number of a's or the number of b's is multiple of 3.**

**Solution:**

6

b)

**Convert the following NFA to DFA**

4

**Solution:****Transition table of  $\lambda$ -NFA:**

state	a	b	$\lambda$ -closure
$\rightarrow q0$	q1	q1	{q0}
$q1^*$	q2	q1	{q0,q1}
$q2^*$	q3	q2	{q1,q2}
q3	$\Phi$	$\Phi$	{q2,q3}

**Transitions:**Start state of DFA is the  $\lambda$ -closure of start state of NFA i.e, q0

$$\delta(q0, a): \lambda\text{-closure}(\delta(q0, a)) = \{q0, q1\}$$

$$\delta(q0, b): \lambda\text{-closure}(\delta(q0, b)) = \{q0\}$$

$$\delta(\{q0, q1\}, a): \lambda\text{-closure}(\delta(q0, a)) \cup \lambda\text{-closure}(\delta(q1, a)) = \{q0, q1, q2\}$$

$$\delta(\{q0, q1\}, b): \lambda\text{-closure}(\delta(q0, b)) \cup \lambda\text{-closure}(\delta(q1, b)) = \{q0, q1\}$$

$$\begin{aligned} \delta(\{q0, q1, q2\}, a): & \lambda\text{-closure}(\delta(q0, a)) \cup \lambda\text{-closure}(\delta(q1, a)) \cup \\ & \lambda\text{-closure}(\delta(q2, a)) \\ & = \{q0, q1, q2, q3\} \end{aligned}$$

$$\begin{aligned} \delta(\{q0, q1, q2\}, b): & \lambda\text{-closure}(\delta(q0, b)) \cup \lambda\text{-closure}(\delta(q1, b)) \cup \\ & \lambda\text{-closure}(\delta(q2, b)) \\ & = \{q0, q1, q2\} \end{aligned}$$

$$\begin{aligned} \delta(\{q0, q1, q2, q3\}, a): & \lambda\text{-closure}(\delta(q0, a)) \cup \lambda\text{-closure}(\delta(q1, a)) \cup \\ & \lambda\text{-closure}(\delta(q2, a)) \cup \\ & \lambda\text{-closure}(\delta(q3, a)) = \{q0, q1, q2, q3\} \end{aligned}$$

$$\begin{aligned} \delta(\{q0, q1, q2, q3\}, b): & \lambda\text{-closure}(\delta(q0, b)) \cup \lambda\text{-closure}(\delta(q1, b)) \cup \\ & \lambda\text{-closure}(\delta(q2, b)) \cup \lambda\text{-closure}(\delta(q3, a)) = \{q0, q1, q2\} \end{aligned}$$

**DFA transition table:**

state	a	b
$\rightarrow q_0$	$\{q_0, q_1\}$	$\{q_0\}$
$\{q_0, q_1\}^*$	$\{q_0, q_1, q_2\}$	$\{q_0, q_1\}$
$\{q_0, q_1, q_2\}^*$	$\{q_0, q_1, q_2, q_3\}$	$\{q_0, q_1, q_2\}$
$\{q_0, q_1, q_2, q_3\}^*$	$\{q_0, q_1, q_2, q_3\}$	$\{q_0, q_1, q_2\}$

3. a) Give a regular expression that accepts a binary string whose decimal value is divisible by 3.

**Solution:**

Regular expression:

$(0+1(01^*0)^*1)^*$

The regular expression is obtained by eliminating the states in the order: q2, q1, q0

5

b) Explain the closure properties of regular languages

**Solution:**

**Closure properties** on regular languages are defined as certain operations on regular languages which are guaranteed to produce another regular language as output.

Closure refers to some operation on a language, resulting in a new language that is of the same “type” as originally operated on.

Consider L and M are regular languages:

Regular languages are closed under the following operations.

- Kleene Closure:

5

		<p>RS is a regular expression whose language is L, M. <math>R^*</math> is a regular expression whose language is <math>L^*</math>.</p> <ul style="list-style-type: none"> <li>• <u>Positive closure:</u> RS is a regular expression whose language is L, M. <math>R^+</math> is a regular expression whose language is <math>L^+</math>.</li> <li>• <u>Complement:</u> The complement of a language L (with respect to an alphabet E such that <math>E^*</math> contains L) is <math>E^* - L</math>. Since <math>E^*</math> is surely regular, the complement of a regular language is always regular.</li> <li>• <u>Reverse Operator:</u> Given language L, <math>L^R</math> is the set of strings whose reversal is in L. Example: <math>L = \{0, 01, 100\}</math>; <math>L^R = \{0, 10, 001\}</math>. Proof: Let E be a regular expression for L. We show how to reverse E, to provide a regular expression <math>E^R</math> for <math>L^R</math>.</li> <li>• <u>Complement:</u> The complement of a language L (with respect to an alphabet E such that <math>E^*</math> contains L) is <math>E^* - L</math>. Since <math>E^*</math> is surely regular, the complement of a regular language is always regular.</li> <li>• <u>Union:</u> Let L and M be the languages of regular expressions R and S, respectively. Then <math>R+S</math> is a regular expression whose language is <math>(L \cup M)</math>.</li> <li>• <u>Intersection:</u> Let L and M be the languages of regular expressions R and S, respectively then it a regular expression whose language is <math>L \cap M</math>.</li> </ul>	
4.	a)	<p><b>Consider the following grammar:</b>  <math>S \rightarrow aSb</math>  <math>S \rightarrow aS</math>  <math>S \rightarrow \epsilon</math></p> <p><b>(a) Give a one-sentence description of the language generated by this grammar.</b></p> <p>The language accepts all the strings that have any number a's or any number of a's followed by any number of b's, It also accepts an empty string.</p> <p>The language accepts the strings of the form : <math>\{a^* + a+b+\}^*</math></p> <p><b>(b) Show that this grammar is ambiguous by giving a string that can be parsed in two different ways. Draw both parse trees.</b></p>	6
			5

<p>Derivation 1:</p> $S \Rightarrow^{lm} aS$ $\Rightarrow^{lm} aaSb$ $\Rightarrow^{lm} aab$	<p>Parse tree 1</p> <pre> graph TD     S1((S)) --- a1((a))     S1 --- S2((S))     S2 --- a2((a))     S2 --- S3((S))     S2 --- b((b))     S3 --- lambda((λ)) </pre>
<p>Derivation 2:</p> $S \Rightarrow^{lm} aSb$ $\Rightarrow^{lm} aaSb$ $\Rightarrow^{lm} aab$	<p>Parse tree 2:</p> <pre> graph TD     S1((S)) --- a1((a))     S1 --- S2((S))     S1 --- b((b))     S2 --- a2((a))     S2 --- S3((S))     S3 --- lambda((λ)) </pre>

**(c) Give an unambiguous grammar that accepts the same language as the grammar above.**

$S \rightarrow aS \mid A$   
 $A \rightarrow aAb \mid \lambda$

b) **Let the alphabet be  $\{a, b\}$  and the language be the set of strings with more a's than b's. Show that this language is not regular using Pumping Lemma for regular languages.**

**Solution:**

- The opponent claims that the language  $L = \{w : n_a(w) > n_b(w) : w \in \{a, b\}^*\}$  is regular
- Let  $n$  be the number of states in the opponent's machine for  $L$  (Pumping length)
- Consider the string,  $w = b^n a^{n+1}$  such that  $|w| \geq n$  and  $w \in L$ .
- We can break such a string  $w$  in three parts  $xyz$ , satisfying the condition  $|xy| \leq n$  and  $|y| > 0$
- Since the first  $n$  symbols are all b's, the loop( $y$ ) is made up of only b's.

Let us assume the string is broken as :

$b^{n-m}(b)^m a^{n+1}$

4

		<p>Here m is the number of b's over which the loop is framed.  <math>1 \leq m &lt; n</math> (as the loop must be made of minimum one symbol and must reside within the n states)</p> <ul style="list-style-type: none"> <li>• <math>b^{n-m}(b^m)^i a^{n+1}</math></li> <li>• if we choose <math>m = 2</math> and <math>i=4</math>  we get <math>b^{n-2}(b^2)^4 a^{n+1}</math>  <math>= b^{n-2}(b^2)^4 a^{n+1}</math>  <math>= b^{n+4} a^{n+1} \notin L</math> because it does not have more a's than b's and we get a contradiction therefore Language is not regular</li> </ul>	
5.	a)	<p><b>Consider the following CFG</b>  <math>S \rightarrow aAS   a</math>  <math>A \rightarrow SbA   SS   ba</math>  <b>Answer the following questions:</b></p> <p>i) <b>What are the terminals, non-terminals and the start symbol of the grammar?</b>  <b>Solution:</b> Terminals: a,b  Nonterminals: S,A  Start Symbol : S</p> <p>ii) <b>Draw parse tree for the following: "aabbaa"</b>  Parse tree :</p> <pre> graph TD     S((S)) --- a1[a]     S --- A1((A))     S --- s1[s]     A1 --- s2[s]     A1 --- b[b]     A1 --- A2((A))     A2 --- a2[a]     A2 --- b2[b]     A2 --- a3[a]     s1 --- a4[a]     s2 --- a5[a] </pre> <p>iii) <b>Give leftmost derivation for the above string.</b></p> $ \begin{aligned} S &\xRightarrow{L} aAS \\ &\xRightarrow{L} aSbAS \\ &\xRightarrow{L} aabAS \\ &\xRightarrow{L} aabbAS \\ &\xRightarrow{L} aabbbaa \end{aligned} $	6
	b)	<p><b>Give equivalent grammar in CNF for the following CFG</b>  <math>S \rightarrow aSbb   T</math>  <math>T \rightarrow bTaa   S   \lambda</math>  <b>Solution:</b>  Remove <math>\lambda</math> , unit and useless production:  <b>Step 1: Eliminate <math>\lambda</math> production:</b>  <math>T \rightarrow \lambda</math> ;  <math>S \rightarrow aSbb   T   \lambda</math>  <math>T \rightarrow bTaa   baa   S</math></p>	4

		<p> <math>S \rightarrow \lambda</math>  <math>S \rightarrow aSbb \mid abb \mid T</math>  <math>T \rightarrow bTaa \mid baa \mid S</math>  <b>Step 2: Eliminate unit production</b>  <b>(<math>S \rightarrow T</math> and <math>T \rightarrow S</math>)</b>  <math>S \rightarrow aSbb \mid abb \mid bTaa \mid baa</math>  <math>T \rightarrow bTaa \mid baa \mid aSbb \mid abb</math>  <b>Step 3: There are no useless production</b>  <math>A \rightarrow a</math>  <math>B \rightarrow b</math>  <math>S \rightarrow ASBB \mid ABB \mid BTAA \mid BAA \mid \lambda</math>  <math>T \rightarrow BTAA \mid BAA \mid ASBB \mid ABB</math>  <b>Step 4: Conversion to CNF</b>  <math>S \rightarrow AF \mid AE \mid BD \mid BC \mid \lambda</math>  <math>T \rightarrow AF \mid AE \mid BD \mid BC</math>  <math>F \rightarrow SE</math>  <math>E \rightarrow BB</math>  <math>D \rightarrow AA</math>  <math>C \rightarrow TD</math>  <math>B \rightarrow b</math>  <math>A \rightarrow a</math> </p>	
6.	a)	<p><b>Give PDA for the following language: <math>D = \{ a^i b^j c^k \mid i, j, k \geq 0, \text{ and } i = j \text{ or } j = k \}</math></b></p> <p><b>Solution:</b></p>	4
	b)	<p><b>For the given grammar, check the acceptance of string <math>w = 10010</math> using CYK Algorithm-</b></p> <p style="text-align: center;"> <math>S \rightarrow XY \mid YZ</math>  <math>X \rightarrow YX \mid 0</math>  <math>Y \rightarrow ZZ \mid 1</math>  <math>Z \rightarrow XY \mid 0</math> </p>	6

**Solution:**

SXZ				
Null	SXZ			
Null	Y	Y		
SX	Y	SZ	SX	
Y	XZ	XZ	Y	XZ
1	0	0	1	0

Since we get S in the topmost box, the string belongs to the language of the grammar.
